

Project InVision International announces Project InVision 2010

New release of on demand project office solution streamlines delivery for service firms

NOVATO, CA – March 25, 2010

San Francisco Bay Area-based Project InVision International, a leading provider of on demand software solutions, announced today the upcoming release of Project InVision 2010, a new version of their Software-as-a-Service (SaaS)-based project office solution.

Project InVision 2010 streamlines the way service firms deliver client engagements, automating a consistent and repeatable service delivery process to increase efficiency, engagement margins, and client satisfaction.

The powerful new features in Project InVision 2010 include a completely redesigned application interface that takes advantage of the latest Web technologies to offer a more intuitive, modern and visually pleasing experience. We've also included a simple, automated routine to enable new users, streamlining the rollout of Project InVision throughout an organization. The release offers a series of technology enhancements to support the latest platform releases from Microsoft including Windows 7, Internet Explorer 8, Windows Server 2008 and SQL Server 2008, and a library of new reports to leverage the power of Microsoft SQL Server Reporting Services. Lastly, the release includes additional enhancements and fixes, based on customer input, to improve the overall usability, stability and performance of Project InVision.

Matt Light, Research VP, Gartner, Inc., the world's leading information technology research and advisory company, agrees that efficiency in project delivery is critical to service firms. "Many professional services firms, responding to the recession, have adapted how they use PPM applications," says Light, "And in moving from fewer time-and-materials contracts to more fixed-fee deals, they've been forced to do better project and portfolio management, from weighing the costs and risks of opportunities to better controlling engagement scope."

"To differentiate themselves in a highly competitive marketplace professional services firms are marketing packaged service offerings," says Matthew B. Meblin, CEO of Project InVision International, "With Project InVision 2010, these firms gain a competitive selling advantage through branded, SaaS-based collaborative solutions to showcase their methodologies and compliment their service offerings."
